

Lab-02: Git Ignore Hands-On Lab – Implementation

Step 1: Navigate to the Existing Git Repository

Open Command Prompt and move to the existing Git repository.

```
cd Desktop  
cd GitDemo
```

Check the repository status.

```
git status
```

Output:

```
On branch main  
nothing to commit, working tree clean
```

Step 2: Create a .log File

Create a log file in the Git working directory.

```
echo Application Started > application.log
```

Verify the file.

```
dir
```

Output:

```
application.log  
welcome.txt
```

Step 3: Create a Log Folder

Create a folder named **log**.

```
mkdir log
```

Move into the folder.

```
cd log
```

Create a log file inside the folder.

```
echo Error Log > error.log
```

Verify the file.

```
dir
```

Output:

```
error.log
```

Return to the Git repository.

```
cd ..
```

Step 4: Verify the Repository Status

Run:

```
git status
```

Output:

On branch main

Untracked files:

application.log

log/

nothing added to commit but untracked files present

At this stage, Git tracks both the .log file and the log folder because they have not yet been ignored.

Step 5: Create the .gitignore File

Create the .gitignore file directly from the command prompt.

```
echo *.log > .gitignore
```

Append the folder rule.

```
echo log/ >> .gitignore
```

Verify the contents.

```
type .gitignore
```

Output:

```
*.log
```

```
log/
```

Step 6: Verify Git Ignore

Run:

```
git status
```

Output:

On branch main

Untracked files:

.gitignore

nothing added to commit but untracked files present

Notice that:

- application.log is no longer displayed.
- log/ folder is no longer displayed.
- Only .gitignore appears because it is not ignored.

This confirms that Git is successfully ignoring the unwanted files and folders.

Step 7: Add the .gitignore File

```
git add .gitignore
```

Verify.

```
git status
```

Output:

Changes to be committed:

new file: .gitignore

Step 8: Commit the Changes

```
git commit -m "Added gitignore file"
```

Example Output:

```
[main xxxxxx] Added gitignore file
1 file changed, 2 insertions(+)
create mode 100644 .gitignore
```

Step 9: Push the Changes to GitHub

```
git push origin main
```

Example Output:

Enumerating objects...

Counting objects...

Writing objects...

Files Created During the Lab

GitDemo/

|

└─ .git/

```
|— .gitignore
|— welcome.txt
|— application.log  (Ignored)
└─ log/            (Ignored)
    └─ error.log
```

.gitignore File Content

```
*.log
log/
```

What Was Implemented

- Opened the existing Git repository.
- Created an application.log file.
- Created a log folder.
- Created an error.log file inside the log folder.
- Created a .gitignore file using Command Prompt.
- Configured .gitignore to ignore all .log files using *.log.
- Configured .gitignore to ignore the entire log folder using log/.
- Verified with git status that the .log file and log folder were ignored.
- Added only the .gitignore file to the staging area.
- Committed the changes to the local repository.
- Pushed the updated repository to GitHub.

Result

The Git Ignore Hands-On Lab was successfully implemented. A .gitignore file was created and configured to ignore all .log files and the log directory. The ignored files were excluded from version control, while the .gitignore file was tracked, committed, and pushed to the remote GitHub repository. This demonstrates how Git Ignore helps maintain a clean repository by preventing unnecessary files and folders from being tracked.

```
Command Prompt
application.log

nothing added to commit but untracked files present (use "git add" to track)
C:\Users\vanka\Desktop\GitDemo>notepad .gitignore
C:\Users\vanka\Desktop\GitDemo>echo *.log > .gitignore
C:\Users\vanka\Desktop\GitDemo>echo log/ >> .gitignore
C:\Users\vanka\Desktop\GitDemo>type .gitignore
*.log
log/

C:\Users\vanka\Desktop\GitDemo>git status
On branch main
Your branch is up to date with 'origin/main'.

Untracked files:
  (use "git add <file>..." to include in what will be committed)
        .gitignore

nothing added to commit but untracked files present (use "git add" to track)
C:\Users\vanka\Desktop\GitDemo>git add .gitignore
C:\Users\vanka\Desktop\GitDemo>git commit -m "Added gitignore file"
[main 59102ff] Added gitignore file
1 file changed, 2 insertions(+)
create mode 100644 .gitignore
C:\Users\vanka\Desktop\GitDemo>git push origin main
